Chris Crompton, Manager, Environmental Resources

Environmental Studies Unit:
Lane Waldner, Supervisor, Environmental Studies
Mel Newman, Environmental Resources Specialist
Bryan Pastor, Engineering Technician
Cesar Sarmiento, Engineering Technician

EXECUTIVE SUMMARY

The 2000-2001 Hydrologic Data Report was prepared to provide a collation of hydrologic information that can be used in water related studies including water quality, sediment transport and watershed runoff modeling. The data is also used in updating the Orange County Hydrology Manual, preparing National Pollution Discharge Elimination System (NPDES) and Total Maximum Daily Load (TMDL) compliance reports, litigation and in designing flood control facilities and water conservation structures.

A summary of the July 1, 2000 - June 30, 2001 season with respect to precipitation, streamflow, evaporation and reservoir/dam operations is presented below.

Precipitation

The 2000-2001 was a below average rainfall year with the season precipitation values ranging between 83 to 135 % of the long term averages. Annual precipitation totals for selected stations in Orange County varied from 12.49 inches at Newport Beach to 31.77 inches at Santiago peak

The Santa Ana precipitation station (Station 121) recorded an annual rainfall total of 14.87 inches which is 1.76 inches greater than the long term average.

Streamflow

The maximum peak discharge for all runoff stations was 4,340 cfs, which was recorded on January 11, 2001 at the San Diego Creek-Campus Drive station.

Discharge records are not included for Lower Oso Creek, Lower East GardenGrove - Wintersburg and Laguna Beach Channel. The stage-discharge relationship for lower Oso is presently being defined and Lower East GardenGrove -Wintersburg and Laguna Beach Channel were undergoing channel improvements and gage house replacement.

Evaporation, Reservoirs and Dams

The maximum monthly evaporation for Villa Park Dam was recorded in July 2000 at 7.59 inches. The total evaporation for the season was 52.26 inches which is 3.44 inches below the long term average.

Villa Park Dam recorded a peak inflow and outflow on February 26 of 4 cfs and November 29 of 5 cfs, respectively. The total dam inflow and outflow for the season was 326 and 259 acre feet, respectively. The maximum storage of 277 acre feet was recorded on May 16.

The total season evaporation for Sulphur Creek Dam was 56.95 inches which was approximately 0.04 inches greater than the long term average. The maximum monthly total of 7.64 inches was recorded in July whereas the lowest monthly total of 1.84 inches was recorded in February.

Sulphur Creek Dam recorded a peak outflow on February 12 of 508 cfs. The total inflow and outflow volumes for Sulphur Creek Dam were 2,119 and 2,120 acre feet, respectively.

SECTION 1.0

INTRODUCTION

INTRODUCTION

The 2000-2001 Hydrologic Data Report contains hydrologic data from Orange County collected during the 12-month period, July 1, 2000 through June 30, 2001. The purpose of the report is to collate hydrologic information that can be used in water related studies including water quality, sediment transport and watershed runoff modeling. The data is also used in updating the Orange County Hydrology Manual, preparing NPDES Stormwater and TMDL compliance reports, litigation and in designing flood control facilities and water conservation structures.

The Hydrologic Data Report is separated into three sections which are briefly discussed below:

1. Precipitation - Describes the precipitation network and summarizes rainfall data for specific stations within Orange County. Included is an overview of the ALERT flood detection system.
2. Streamflow - Provides information regarding the streamgaging network and includes monthly and seasonal discharge data for selected stations. Also provided is information on the USGS streamgaging stations in Orange County.
3. Evaporation, Reservoirs and Dams - Provides data for several historical and current evaporation stations. Also provided is a summary of the flood control and water conservation dams with specific data for Villa Park, Sulphur Creek and Prado Dams.

SECTION 2.0

PRECIPITATION

2.0 PRECIPITATION

2.1 Overview

The Public Facilities and Resources Department (PFRD) maintains records for 165 recording/non-recording precipitation stations in and adjacent to Orange County. Station locations are shown in **Figures 1 and 2**. Of these, 45 are active precipitation stations; 14 of which are operated and maintained by PFRD. The remaining stations are operated and maintained through the Department's cooperative observer program. Station names, type of raingage, period of record and observer are listed in **Tables 1 and 2**. The longest period of record for an active precipitation station is Tustin-Irvine Ranch (Station #61) which dates back to the late 1800's.

In addition to the recording/non-recording rainfall stations, PFRD operates and maintains the ALERT (Automated Local Evaluation in Real Time) flood detection system. The ALERT precipitation network consists of 67 rain and snow gages located throughout Orange County and surrounding areas described in **Table 3**. A map which shows the location of the ALERT rainfall stations is shown in **Figure 3**.

The ALERT system is an automated, real-time radio reporting flood detection system. Each ALERT precipitation gage is a modular, self contained, event recording unit which transmits rainfall in real time to the base station computer located at the Katella Facility. During storm events, a tipping bucket mechanism records each 0.04 inches of rainfall which causes the electronics and radio package to transmit a station identification and precipitation value to the base station computer. The precipitation value is stored as an accumulated total. At stations equipped with both standard and ALERT raingages, the readings from the standard gages are used to verify the records produced by ALERT.

Components of the ALERT system are presented in **Figure 4**.

2.2 2000-2001 Data Presentation

Precipitation summaries for 18 selected stations and a map showing respective station locations are shown in **Table 4 and Figure 5**. Stations were selected to give a representative picture of the rainfall occurring throughout Orange County during the 2000-2001. Tables **5-22** provide a summary of daily and monthly total rainfalls.

Total season precipitation values for the stations ranged from 83% to 135% of the long term averages. Annual precipitation totals for selected stations in Orange County varied from 12.49 inches at Newport Beach to 31.77 inches at Santiago peak

The Santa Ana precipitation station (Station 121) recorded an annual rainfall total of 14.87 inches which is 1.76 inches greater than the long term average.

Short and long duration rainfall intensities and their return frequencies for 30 precipitation stations are listed in **Tables 23 and 24**. Station locations are presented in **Figure 6**.

A graph which shows the flood years and annual rainfall totals recorded at the Santa Ana Station (Station 121) for the period 1909-2001 is presented in **Figure 7**.

Equal lines of precipitation for the 2000-01 season and 40-year mean are presented in the isohyetal maps shown in **Figures 8 and 9**.

SECTION 3.0

STREAMFLOW

3.0 STREAMFLOW

3.1 Overview

PFRD operates and maintains eighteen (18) streamgaging and two (2) tidal stations in Orange County. Each station is equipped with a continuous water-stage recorder and ALERT transmitter/data logger and water level sensor. The ALERT water level sensor provides the ability to monitor the stage at each station in real time. The water level sensor identifies a change in stage sending a signal to the ALERT transmitter which transmits the station identification and a water level value to the base station computer located at the PFRD Katella Facility. The ALERT water level data is stored on a server and is available as a backup to the water stage recorder charts.

Mean daily and total annual discharges are computed from station water stage recorder charts and ALERT data. The Western Hydrologic Data Reduction System is used to assist in computation. Automatic computation of surface water records is performed by electronically converting gage heights to discharges from channel ratings. Annual discharge data associated with each station are stored on a server.

3.2 2000-2001 Data Presentation

Figure 10 shows the location of the PFRD streamgaging and tidal stations. Streamflow summaries are presented in **Table 25** and include peak discharge, minimum and maximum discharges, and total runoff volume. Daily discharge summaries for the stations are presented in **Tables 27 through 41**. Location maps and specifics for each station are presented in **Figures 12 through 26**.

Historical discharge summaries for each of the gaging stations are listed in **Appendix A**.

The USGS has several streamgaging stations in or affecting Orange County. Provisional discharge data for six USGS stations are provided in **Tables 42 through 47**. Two of the stations; Arroyo Trabuco and Modjeska Canyon, are cooperative stations with PFRD incurring 50% of the annual operation and maintenance costs for each station.

Listed in **Table 26** is the drainage area, period of record and momentary peak discharge for each respective station. Station locations of the USGS gaging stations are shown in **Figure 11**. Complete data for the USGS stations are published in the report entitled “Water Resources Data for California (Part 1).”

The maximum peak discharge for all runoff stations was 4,340 cfs, which was recorded on January 11, 2001 at the San Diego Creek-Campus Drive station.

Discharge records are not included for Lower Oso Creek, Lower East Garden Grove - Wintersburg and Laguna Beach Channel. The stage-discharge relationship for lower Oso is presently being defined and Lower East Garden Grove -Wintersburg and Laguna Beach Channel were undergoing channel improvements and gage house replacement.

ALISO CREEK AT JERONIMO STATION NO. 4

LOCATION: Latitude $33^{\circ} 37' 30''$, Longitude $117^{\circ} 41' 07''$. On the right bank approximately 300 ft. upstream of Jeronimo Rd.

DRAINAGE AREA: 8.10 sq. mi (21.0 km²)

GAGE ELEVATION: 430 ft. (131 m) MSL

HYDRAULIC CONTROL: Downstream critical depth control and supercritical flow - step-designed concrete channel

EQUIPMENT: Stevens A-71 water-stage recorder with Balanced Beam Manometer and ALERT rain gage and water level sensor.

PERIOD OF RECORD: October 1930 to present

REMARKS: Several small conservation reservoirs in watershed above gage. Normal flow affected by return flow from irrigated areas and discharge from local supply reservoir. Low flow affected by summer algae blooms in channel.

**RATING CURVE
ACCURACY:** Good

OSO CREEK AT CROWN VALLEY PARKWAY STATION NO. 218

LOCATION:	Latitude $33^{\circ}33' 29''$, Longitude $117^{\circ}40' 33''$. On the right bank approximately 1200 ft. west of the intersection of Crown Valley Parkway and San Diego Freeway.
DRAINAGE AREA:	14.0 sq. mi. (36.2 km^2)
GAGE ELEVATION:	250 ft. (76.0 m) MSL
HYDRAULIC CONTROL:	Downstream critical depth control and supercritical and subcritical flow trapezoidal, rip rap/earthen channel.
EQUIPMENT:	Stevens A-71 water-stage recorder with float, ALERT rain gage and water level sensor.
PERIOD OF RECORD:	December 1969 to present
REMARKS:	A grouted rock structure about 130 ft. downstream of the gage serves as the control for low to medium-high stages.
RATING CURVE ACCURACY:	Fair

SECTION 4.0

EVAPORATION, DAMS AND RESERVOIR

4.0 EVAPORATION, RESERVOIRS AND DAMS

4.1 Overview

PFRD maintains and operates two evaporation stations which are located at Sulphur Creek Dam and Villa Park Dam. Each station has a weather bureau-type class A land evaporation pan which is 48 inches in diameter and 10 inches deep and constructed of galvanized sheet metal. In addition, records are kept for six historical evaporation stations. **Figure 27** shows the location for historical and active evaporation stations.

Table **48** lists the name and number, location and period of record for each evaporation station. Monthly evaporation for the Villa Park Dam (1974-2001) and Sulphur Creek Dam (1978-2001) are listed in **Tables 49 and 50**.

There are seven major flood control and water conservation dams in and near Orange County as shown in **Figure 28** and described in **Table 51**. Two of the dams, Villa Park and Sulphur Creek, are operated by PFRD.

Season reservoir operation summaries for the two dams are presented in **Tables 52 and 53**. **Table 54** provides an operational summary for Villa Park Dam (1965-2001).

The maximum storage for Villa Park and Prado Dams from 1965-2001, as percent capacity at the spillway crest, is shown in **Figure 29**.

4.2 2000-2001 Data Presentation

The maximum monthly evaporation for Villa Park Dam was recorded in July 2000 at 7.59 inches. The total evaporation for the season was 52.26 inches which is 3.44 inches below the long term average.

Villa Park Dam recorded a peak inflow and outflow on February 26 of 4 cfs and November 29 of 5 cfs, respectively. The total dam inflow and outflow for the season was 326 and 259 acre feet, respectively. The maximum storage of 277 acre feet was recorded on May 16.

The total season evaporation for Sulphur Creek Dam was 56.95 inches which was approximately 0.04 inches greater than the long term average. The maximum monthly total of 7.64 inches was recorded in July whereas the lowest monthly total of 1.84 inches was recorded in February.

Sulphur Creek Dam recorded a peak outflow on February 12 of 508 cfs. The total inflow and outflow volumes for Sulphur Creek Dam were 2,119 and 2,120 acre feet, respectively.

Prado Dam recorded a maximum storage for the season of 10,881 acre feet which was 5.8 percent of the dam's maximum capacity.
